Grade	10.00 out of 10.00 (100%)

Question 1
Correct
Mark 100 out of 100
Flag question
Edit question

Given a number N. Find the next perfect square greater than N.

Input Format:

Integer input from stdin.

Output Format:

Perfect square greater than N

Example Input:

9

Output:

16

For example:

Input	Result
9	16
25	36

Answer: (penalty regime: 0 %)

```
n=int(input())
for i in range(n,n*n+1):
    if(i**0.5==int(i**0.5)):
        print(i)
        break
```

Input	Expected	Got
9	16	16
25	36	36

Passed all tests! ✓

Correct

Question 2
Correct
Mark 100 out of 100
Flag question
Edit question

Let's print a chessboard.

Write a program that takes input

Integer N,representing the rows and columns of a chessboard and also the starting character of the chessboard

Output Format

Print the chessboard as per the given examples

Sample Input/Output

Input1

2

X

Output1

XB

BX

Answer: (penalty regime: 0 %)

```
n=int(input())
ch=input()
for i in range(n):
    for j in range(n):
        if(ch=='X'):
            print("X",end="")
            ch='B'
        else:
            print("B",end="")
            ch='X'
    print()
```

Input	Expected	Got
2 X	XB BX	XB BX
3 B	BXB XBX BXB	BXB XBX BXB

Passed all tests! ✓

Correct

Question 3
Correct
Mark 100 out of 100
Flag question
Edit question

Write a program that given an integer 'n' prints the number of integers that are less than or equal to 'n' and co-prime to 'n'.

Two integers a and b are said to be relatively prime or co-prime if the only positive integer that evenly divides both of them is 1. That is, the only common positive factor of the two numbers is 1. This is equivalent to their greatest common divisor being 1.

Input Format:

One line containing the value of 'n', where 'n<=10,000

Output Format:

One line containing the number of integers that are co-prime to n and less than or equal to 'n'

Sample Test Cases

Test Case 1

Input

10

Output

4

Test Case 2

Input

23

Output

22

Test Case 3

Input

1

Output

10

Answer: (penalty regime: 0 %)

```
n=int(input())
count=0
for i in range(1,n+1):
    if(gcd(i,n)==1):
        count+=1
print(count)
```

Input	Expected	Got
10	4	4
23	22	22
1	10	10

Passed all tests! ✓

Correct

Question 4
Correct
Mark 100 out of 100
Flag question
Edit question

Given a positive integer n, find the smallest positive integer k whose multiplication of each digit equals to n.

If there is no answer or the answer is not fit in 32-bit signed integer, then return 0.

Example 1:

Input:

48

Output:

68

Example 2

Input:

15

Output:

35

For example:

Input	Result
48	68
15	35

Answer: (penalty regime: 0 %)

```
n=int(input())
if n<10:
    print(n)
else:
    digits=[]
    for i in range(9,1,-1):
        while n%i==0:
            digits.append(i)
            n//=i
    if n>1:
        print(0)
    else:
        print(''.join(map(str,digits[::-1])))
```

Input	Expected	Got
48	68	68
15	35	35

Question 5
Correct
Mark 100 out of 100
Flag question
Edit question

You are choreographing a circus show with various animals. For one act, you are given two kangaroos on a number line ready to jump in the positive direction.

You are given four integers, x1, v1, x2, and v2, representing the starting position and jump velocity for each kangaroo.

The second kangaroo starts at position x2 , and moves at a speed of v2 meters per jump. and x1 , x2 .

Determine if the kangaroos will ever be at the same location at the same time at part of the show before it jumps. If it is possible, return YES, otherwise return NO.

Input Format:

1st position of kangaroo1

1st velocity of kangaroo1

2nd position of kangaroo2

2nd velocity of kangaroo2

4 values

Output Format:

Print 'YES' if they are at the same position which is jumps, 'NO, otherwise NO.

For example:

Input	Result
0 3 4 2	YES
0 2 5 3	NO

Answer: (penalty regime: 0 %)

```
x1=int(input())
v1=int(input())
x2=int(input())
v2=int(input())
if(x1<x2 and v1<v2) or (x1>x2 and v1>v2):
    print("NO")
else:
    print("NO")
```

Input	Expected	Got
0 3 4 2	YES	YES
0 2 5 3	NO	NO
4 1 0 3	NO	NO

Edit question

Write a program to find the count of non-repeated digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number >= 0 and <= 250000.

Some examples are as below.

If the given number is 353, the program should return 1 because there is only 1 non-repeated digit '5' in the number.

If the given number is 3553, the program should return 2 because there are 2 non-repeated digits in this number, '5' and '3'.

If the given number is 1256, the program should return 4 because there are 4 non-repeated digits in this number, '1', '2', '5' and '6'.

If the given number is 23, the function should return 2 because there are NO non-repeated digits in this number.

For examples:

Input	Result
353	1
3553	2
1256	4
23	2

Answer: (penalty regime: 0 %)

```
n=int(input())
count=0
for i in set(str(n)):
    if str(n).count(i)==1:
        count+=1
print(count)
```

Input	Expected	Got
353	1	1
3553	2	2
1256	4	4
23	2	2

Question 7
Correct
Mark 100 out of 100
Flag question
Edit question

Write a program to find the count of the number of prime numbers in a specified range.

The lower limit and the upper limit of the range will be provided as input to the program.

Assumption: 2 <=(starting number of the range) <=(ending number of the range) <=5242

If the starting number of the range is given as 2 and 20, the program must return 8, because there are 8 prime numbers in the range 2 to 20 (both inclusive) and they are 2, 3, 5, 7, 11, 13, 17, 19.

Examples: If the starting and ending number of the range is given as 700 and 751, the program must return 5, because there are 5 prime numbers in the specified range from 700 to 751, namely, 701, 709, 719.

For example:

Input	Result
2 20	8
700 751	5

Answer: (penalty regime: 0 %)

```
n1=int(input())
n2=int(input())
for i in range(n1,n2+1):
    for j in range(2,int(i**0.5)+1):
        if(i%j==0):
            break
    else:
        print(i,end=" ")
```

Input	Expected	Got
2 20	2 3 5 7 11 13 17 19	2 3 5 7 11 13 17 19
700 751	701 709 719 727 733	701 709 719 727 733

Edit question

An automorphic number is a number whose square ends with the number itself.

Write a program to find out whether a given number between 0 to 1000 is an automorphic number or not.

If the given number

If it is an automorphic number display "Automorphic" else display "Not Automorphic"

Input Format:

Input a number from keyboard

Print Automorphic if given number is Automorphic number, otherwise Not Automorphic

Example Input1:

5

Output:

Automorphic

Example Input2:

9

Output:

Not Automorphic

Answer: (penalty regime: 0 %)

```
n=int(input())
if n**2%(10**len(str(n)))==n:
    print("Automorphic")
else:
    print("Not Automorphic")
```

Input	Expected	Got
25	Automorphic	Automorphic
1475	Automorphic	Automorphic
9	Not Automorphic	Not Automorphic

Edit question

A Number is said to be Disarium number when the sum of its digit raised to the power of their respective positions becomes equal to the number itself. Write a program to print number is Disarium or not.

Input Format

Single Integer Input from stdin.

Output Format

None No

Example Input:

175

Output:

Yes

Explanation:

1^1 + 7^2 + 5^3 is 175

Example Input:

9

Output:

No

For example:

Input	Result
175	Yes
9	No

Answer: (penalty regime: 0 %)

```
n=int(input())
s=0
for i in str(n):
    s+=int(i)**(int(str(n).index(i))+1)
if n==s:
    print("Yes")
else:
    print("No")
```

Input	Expected	Got
175	Yes	Yes
1	Yes	Yes
135	Yes	Yes
89	Yes	Yes
9	No	No
1784	No	No

Edit question

Write a python program to print the following pattern based on input size.

Input:

3

Output:

```
1
2 3
4 5 6
```

For example:

Input	Result
3	1 2 3 4 5 6
4	1 2 3 4 5 6 7 8 9 10

Answer: (penalty regime: 0 %)

```
n=int(input())
num=1
for i in range(1,n+1):
    for j in range(1,i+1):
        print(num,end=" ")
        num+=1
    print()
```

Input	Expected	Got
3	1 2 3 4 5 6	1 2 3 4 5 6
4	1 2 3 4 5 6 7 8 9 10	1 2 3 4 5 6 7 8 9 10
5	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15
