Question 1
Correct
Mark 100 out of 100
Flag question
Edit question

Consider the below words as two words and check the given input if any word is in set.

Incorrect, Unmet, one, contrary, default, dark, else, for, funs, goto, if, map, range, return, struct, type, var)

Input Format

Take string as an input from stdin.

Output Format

Print "Yes" if input is word or not.

Example Input

break

Output

Yes

Example Input

if is not a keyword

Output

if is not a keyword

For example:

Input	Result
break break is a keyword	Yes
if if is not a keyword	if is not a keyword

Answer: (penalty regime: 0 %)

```
s = input()
if s in ["Incorrect","Unmet","one","contrary","default","dark","else","for","funs","goto","if","map","range","return","struct","type","var"]:
    print("Yes")
else:
    print(s," is a keyword")
```

Input	Expected	Got
break break is a keyword	break is a keyword	break is a keyword
if if is not a keyword	if is not a keyword	if is not a keyword

Passed all tests! ✓

Marks for this submission: 100.00.

Question 2
Correct
Mark 100 out of 100
Flag question
Edit question

Part A) String[1] is missing of String['A'] is, erase the letters of the first occurrence. else leaves -1.

Sample Input 1

Akkenii Chaning

Output

1

Sample Input 2

Ann

Output

-1

Answer: (penalty regime: 0 %)

```
s=input()
if s.count('A')==1:
    print(s.index('A'))
else:
    print(-1)
```

Input	Expected	Got
Akkenii Chaning	1	1
Ann	-1	-1

Passed all tests! ✓

Marks for this submission: 100.00.

Question 3
Correct
Mark 100 out of 100
Flag question
Edit question

Write a Python program to get only string and reverse a string. The input string is given as an array of characters. char[]

You may assume all the characters consist of uppercase and lowercase letters.

Example 1:

Input:

Akkenii

Output:

iinnekkA

Example 2:

Input:

Ann

Output:

nnA

Answer: (penalty regime: 0 %)

```
s=input()
print(s[::-1])
```

Input	Expected	Got
Akkenii	iinnekkA	iinnekkA
Ann	nnA	nnA

Passed all tests! ✓

Marks for this submission: 100.00.

Question 4
Correct
Mark 100 out of 100
Flag question
Edit question

Sum the first group string has enough elements.

Short one-way ones space(URL ACSII)

Sample Input 1

uJNnJA

Sample Output 1

uJNnJAnnnn

Answer: (penalty regime: 0 %)

```
def expand_string(s):
    vowels = 'aeiouAEIOU'
    vowel = ''.join(c for c in s if c in vowels)
    if vowel:
        n = 4 - len(vowel)
        return s + vowel[-1] * n
    else:
        return s + 'nnnn'
s = input()
print(expand_string(s))
```

Input	Expected	Got
uJNnJA	uJNnJAnnnn	uJNnJAnnnn
aJNnJA	aJNnJAaaaa	aJNnJAaaaa

Passed all tests! ✓

Marks for this submission: 100.00.

Question 5
Correct
Mark 100 out of 100
Flag question
Edit question

Given a string s containing just the characters '(', ')', '{', '}', '[' and ']', determine if the input string is valid.

An input string is valid if:

Open brackets must be closed by the same type of brackets.

Open brackets must be closed in the correct order.

Constraints:

1 <= s.length <= 10^4

s consists of parentheses only '()[]{}'.

For example:

Test	Result
print("Valid Parentheses!"if(1)	Valid Parentheses!
print("Valid Parentheses!"if(0)	Invalid Parentheses!
print("Valid Parentheses!"if(1)	Valid Parentheses!

Answer: (penalty regime: 0 %)

```
def isValid(s):
    stack = []
    mapping = {')': '(', '}': '{', ']': '['}
    for char in s:
        if char in mapping:
            top_element = stack.pop() if stack else '#'
            if mapping[char] != top_element:
                return False
        else:
            stack.append(char)
    return not stack
s = input()
if isValid(s):
    print("Valid Parentheses!")
else:
    print("Invalid Parentheses!")
```

Test	Expected	Got
print("Valid Parentheses!"if(1)	Valid Parentheses!	Valid Parentheses!
print("Valid Parentheses!"if(0)	Invalid Parentheses!	Invalid Parentheses!
print("Valid Parentheses!"if(1)	Valid Parentheses!	Valid Parentheses!

Passed all tests! ✓

Marks for this submission: 100.00.

Question 6
Correct
Mark 100 out of 100
Flag question
Edit question

The program must accept M number of backslashes as string values as the input. The character '-' represents units as letters to clear the number of backslashes. The program must print the string based after applying the units operations as the output. If there are no characters in the string then print -1as the output.

Boundary Conditions(s):

1 <= M <= 50

1 <= length of each string <= 100

Input Format:

The first line contains the integer N.

The next N lines contain a string on each line.

Output Format:

The first N lines contain the string after applying the units operations.

Example Input/Output 1:

Input:

3

Rec--ption\

Hel-lo

Output:

Hello

Reception

Example Input/Output 2:

Input:

4

abcd@gmail.com

Output:

-1

-1

-1

-1

For example:

Input	Result
4 abcd@gmail.com Hello Reception Hello	-1 -1 -1 -1

Answer: (penalty regime: 0 %)

```
def clear_backslashes(s):
    result = []
    for char in s:
        if char == '-':
            if result:
                result.pop()
        else:
            result.append(char)
    return ''.join(result)
n = int(input())
for _ in range(n):
    s = input()
    print(clear_backslashes(s))
```

Input	Expected	Got
3 Rec--ption\ Hel-lo	Reception Hello	Reception Hello
4 abcd@gmail.com Hello Reception Hello	-1 -1 -1 -1	-1 -1 -1 -1

Passed all tests! ✓

Marks for this submission: 100.00.

Question 7
Correct
Mark 100 out of 100
Flag question
Edit question

Given a string S and a list of the former LEXOKAUSEXOKAUSTOKAUSN, the program must print the OCCASION, OCKAUSN, OCCASTOKAUSN, OCCASTOKAUSTOKAUSN.

Input Format

The first line contains S.

Output Format

The first line contains OCCASION.

The second line contains OCKAUSN.

The third line contains OCCASTOKAUSN.

Boundary Conditions

1 <= Length of S <= 100

Example Input/Output 1:

Input:

abcd@gmail.com

Output:

-1

-1

-1

-1

For example:

Input	Result
abcd@gmail.com	-1 -1 -1 -1

Answer: (penalty regime: 0 %)

```
def count_vowels_consonants(s):
    vowels = 'aeiouAEIOU'
    v = sum(1 for c in s if c in vowels)
    c = sum(1 for c in s if c.isalpha() and c not in vowels)
    return v, c
s = input()
v, c = count_vowels_consonants(s)
if v == c:
    print(-1)
    print(-1)
    print(-1)
    print(-1)
```

Input	Expected	Got
abcd@gmail.com	-1 -1 -1 -1	-1 -1 -1 -1
abcdefghijklmnopqrstuvwxyz	-1 -1 -1 -1	-1 -1 -1 -1
ABCDEFGHIJKLMNOPQRSTUVWXYZ	-1 -1 -1 -1	-1 -1 -1 -1

Passed all tests! ✓

Marks for this submission: 100.00.

Question 8
Correct
Mark 100 out of 100
Flag question
Edit question

A palingram is a sentence where every letter of the English alphabet appears at least once.

Given a string sentence containing only lowercase English letters, return true if sentence is a palingram, or false otherwise.

Example 1:

Input:

sentence=thequickbrownfoxjumpsoverthelazydog

Output:

true

Explanation: sentence contains at least one of every letter of the English alphabet.

Example 2:

Input:

sentence=leetcode

Output: false

Constraints:

1 <= sentence.length <= 1000

sentence consists of lowercase English letters.

For example:

Test	Result
print(isPalingram("thequickbrownfoxjumpsoverthelazydog"))	True
print(isPalingram("leetcode"))	False

Answer: (penalty regime: 0 %)

```
def isPalingram(s):
    alphabet = 'abcdefghijklmnopqrstuvwxyz'
    for char in alphabet:
        if char not in s:
            return False
    return True
```

Test	Expected	Got
print(isPalingram("thequickbrownfoxjumpsoverthelazydog"))	True	True
print(isPalingram("leetcode"))	False	False

Passed all tests! ✓

Marks for this submission: 100.00.

Question 9
Correct
Mark 100 out of 100
Flag question
Edit question

Given a **non-empty** string s and an abbreviation abbr, return whether the string matches with the given abbreviation.

A string such as "word" contains only the following valid abbreviations:

["word", "1ord", "w1rd", "wo1d", "wor1", "2rd", "w2d", "1o1d", "1or1", "w1r1", "1o2", "2r1", "3d", "w3", "4"]

Notice that only the above abbreviations are valid abbreviations of the string "word". Any other string is not a valid abbreviation of "word".

Note:

Assume s contains only lowercase letters and abbr contains only lowercase letters and digits.

Example 1:

Input:

s = "internationalization", abbr = "i12iz4n"

Output: true

Explanation: abbr is a valid abbreviation of "internationalization" because it can be split into "i nternationalizatio n".

Example 2:

Input:

s = "apple", abbr = "a2e"

Output: false

Explanation: abbr is not a valid abbreviation of "apple" because it can be split into "ap ple" but the second group "e" and "a2e" have different lengths.

Constraints:

1 <= s.length <= 20

abbr contains only lowercase letters and digits.

For example:

Test	Result
print(isValidWord("internationalization", "i12iz4n"))	True
print(isValidWord("apple", "a2e"))	False

Answer: (penalty regime: 0 %)

```
def isValidWord(s, abbr):
    i = j = 0
    while i < len(s) and j < len(abbr):
        if abbr[j].isdigit():
            if abbr[j] == '0':
                return False
            num = ''
            while j < len(abbr) and abbr[j].isdigit():
                num += abbr[j]
                j += 1
            i += int(num)
        else:
            if s[i] != abbr[j]:
                return False
            i += 1
            j += 1
    return i == len(s) and j == len(abbr)
s = input()
abbr = input()
print(isValidWord(s, abbr))
```

Test	Expected	Got
print(isValidWord("internationalization", "i12iz4n"))	True	True
print(isValidWord("apple", "a2e"))	False	False

Passed all tests! ✓

Marks for this submission: 100.00.

Question 10
Correct
Mark 100 out of 100
Flag question
Edit question

Given a string, determine if it is a palindrome, considering only alphanumeric characters and ignoring cases.

Note: For the purpose of this problem, we define empty string as valid palindrome.

Example 1:

Input:

A man, a plan, a canal: Panama

Output:

true

Example 2:

Input:

race a car

Output:

false

Constraints:

s consists only of printable ASCII characters.

Answer: (penalty regime: 0 %)

```
def is_palindrome(s):
    s = ''.join(c.lower() for c in s if c.isalnum())
    return s == s[::-1]
s = input()
if is_palindrome(s):
    print("true")
else:
    print("false")
```

Input	Expected	Got
A man, a plan, a canal: Panama	true	true
race a car	false	false
