Question **1**
Correct
Mark 1.00 out of 1.00
Flag question

Create a Python program to write to a specific line in a text file, replacing the existing content of that line.

**Description:**

1. **Input:**
   - A text file with multiple lines.
   - A line number to write to.
   - New content for the specified line.
2. **Output:**
   - The updated file with the specified line replaced by the new content in file "output.txt".

**Example:**

- **Input File Content:**

  **"Line one.**
  **Line two.**
  **Line three.**
  **Line four."**
  **2**

  **Updated line two.**

**Output:**

Line one.
Updated line two.
Line three.
Line four.

**For example:**

<table>
<tr><th>Test</th><th>Input</th><th>Result</th></tr>
<tr><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt
2
Updated line two.</pre></td><td><pre>Line one.
Updated line two.
Line three.
Line four.</pre></td></tr>
</table>

**Answer:** (penalty regime: 0 %)

```python
filename = input()
line_no = int(input())
new_content = input()

with open(filename, 'r') as f:
    lines = f.read().split('\n')

if 1 <= line_no <= len(lines):
    lines[line_no - 1] = new_content

with open('output.txt', 'w') as f:
    f.write('\n'.join(lines))
```

<table>
<tr><th></th><th>Test</th><th>Input</th><th>Expected</th><th>Got</th><th></th></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt
2
Updated line two.</pre></td><td><pre>Line one.
Updated line two.
Line three.
Line four.</pre></td><td><pre>Line one.
Updated line two.
Line three.
Line four.</pre></td><td>✓</td></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input2.txt
2
Line B Updated.</pre></td><td><pre>Line A.
Line B Updated.
Line C.</pre></td><td><pre>Line A.
Line B Updated.
Line C.</pre></td><td>✓</td></tr>
</table>

Passed all tests! ✓

**Correct**
Marks for this submission: 1.00/1.00.

Question **2**
Correct
Mark 1.00 out of 1.00
Flag question

Create a Python program to delete a specific line from a text file based on a given line number.

**Description:**

1. **Input:**
   - A text file with multiple lines.
   - A line number to delete.
2. **Output:**
   - The updated file with the specified line removed in file "output.txt".

**Example:**

- **Input File Content:**

  **"Line one.**
  **Line two.**
  **Line three.**
  **Line four."**
  **2**

  **Updated line two.**

**Output:**

Line one.
Line three.
Line four.

**For example:**

<table>
<tr><th>Test</th><th>Input</th><th>Result</th></tr>
<tr><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt
2</pre></td><td><pre>Line one.
Line three.
Line four.</pre></td></tr>
</table>

**Answer:** (penalty regime: 0 %)

```python
filename = input()
line_no = int(input())

with open(filename, 'r') as f:
    lines = f.read().split('\n')

if 1 <= line_no <= len(lines):
    lines.pop(line_no - 1)

with open('output.txt', 'w') as f:
    f.write('\n'.join(lines))
```

<table>
<tr><th></th><th>Test</th><th>Input</th><th>Expected</th><th>Got</th><th></th></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt
2</pre></td><td><pre>Line one.
Line three.
Line four.</pre></td><td><pre>Line one.
Line three.
Line four.</pre></td><td>✓</td></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input2.txt
3</pre></td><td><pre>Line A.
Line B.</pre></td><td><pre>Line A.
Line B.</pre></td><td>✓</td></tr>
</table>

Passed all tests! ✓

**Correct**
Marks for this submission: 1.00/1.00.

Question **3**
Correct
Mark 1.00 out of 1.00
Flag question

Develop a Python program to copy the contents of one file to another file.

**Description:**

1. **Input:**
   - Source file and destination file names.
2. **Output:**
   - The content of the source file copied to the destination file.

**For example:**

<table>
<tr><th>Test</th><th>Input</th><th>Result</th></tr>
<tr><td><pre>with open('output1.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt
output1.txt</pre></td><td><pre>This is the source file.
It contains multiple lines of text.
Here is another line.</pre></td></tr>
</table>

**Answer:** (penalty regime: 0 %)

```python
source = input()
destination = input()

with open(source, 'r') as f:
    content = f.read()

with open(destination, 'w') as f:
    f.write(content)
```

<table>
<tr><th></th><th>Test</th><th>Input</th><th>Expected</th><th>Got</th></tr>
<tr><td>✓</td><td><pre>with open('output1.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt
output1.txt</pre></td><td><pre>This is the source file.
It contains multiple lines of text.
Here is another line.</pre></td><td><pre>This is the
It contains
Here is anot</pre></td></tr>
<tr><td>✓</td><td><pre>with open('output2.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input2.txt
output2.txt</pre></td><td><pre>Hello, world!
Python programming is amazing.
Let's copy this text to another file.</pre></td><td><pre>Hello, world
Python progr
Let's copy t</pre></td></tr>
<tr><td>✓</td><td><pre>with open('output3.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input3.txt
output3.txt</pre></td><td><pre>Single line.</pre></td><td><pre>Single line.</pre></td></tr>
</table>

Passed all tests! ✓

**Correct**
Marks for this submission: 1.00/1.00.

Question **4**
Correct
Mark 1.00 out of 1.00
Flag question

Develop a Python program to read a text file and count the total number of words in the file.

**Description:**

1. **Input:**
   - A text file containing several lines of text.
   - File name you should get as input.
2. **Output:**
   - The total number of words in the file.

**For example:**

| Input | Result |
|---|---|
| `input2.txt` | `Total words: 14` |
| `input3.txt` | `Total words: 15` |

**Answer:** (penalty regime: 0 %)

```python
filename = input()

with open(filename, 'r') as f:
    content = f.read()

words = content.split()
print("Total words:", len(words))
```

| | Input | Expected | Got | |
|---|---|---|---|---|
| ✓ | `input1.txt` | `Total words: 6` | `Total words: 6` | ✓ |
| ✓ | `input2.txt` | `Total words: 14` | `Total words: 14` | ✓ |
| ✓ | `input3.txt` | `Total words: 15` | `Total words: 15` | ✓ |

Passed all tests! ✓

**Correct**
Marks for this submission: 1.00/1.00.

Question **5**
Correct
Mark 1.00 out of 1.00
Flag question

Develop a Python program to identify and print all palindrome words from a given text file.

**Description:**

1. **Input:**
   - A text file containing multiple words.
2. **Output:**
   - A list of palindrome words found in the file name as 'output.txt'.

**For example:**

<table>
<tr><th>Test</th><th>Input</th><th>Result</th></tr>
<tr><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt</pre></td><td><pre>madam
arora
malayalam</pre></td></tr>
</table>

**Answer:** (penalty regime: 0 %)

```python
filename = input()

with open(filename, 'r') as f:
    words = f.read().split()

palindromes = []
for word in words:
    if word == word[::-1]:
        palindromes.append(word)

with open('output.txt', 'w') as f:
    f.write('\n'.join(palindromes))
```

<table>
<tr><th></th><th>Test</th><th>Input</th><th>Expected</th><th>Got</th><th></th></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt</pre></td><td><pre>madam
arora
malayalam</pre></td><td><pre>madam
arora
malayalam</pre></td><td>✓</td></tr>
</table>

Passed all tests! ✓

**Correct**
Marks for this submission: 1.00/1.00.

Question **6**
Correct
Mark 1.00 out of 1.00
Flag question

Develop a Python program to read a specific line from a text file based on a given line number.

**Description:**

1. **Input:**
   - A text file with multiple lines.
   - A line number to read.
2. **Output:**
   - The content of the specified line.

input1.txt:

Line one.
Line two.
Line three.
Line four.

**For example:**

| Input | Result |
|---|---|
| `input1.txt`<br>`3` | `Line three.` |

**Answer:** (penalty regime: 0 %)

```python
filename = input()
line_no = int(input())

with open(filename, 'r') as f:
    lines = f.read().split('\n')

if 1 <= line_no <= len(lines):
    print(lines[line_no - 1])
```

| | Input | Expected | Got | |
|---|---|---|---|---|
| ✓ | `input1.txt`<br>`3` | `Line three.` | `Line three.` | ✓ |
| ✓ | `input2.txt`<br>`3` | `Line C.` | `Line C.` | ✓ |

Passed all tests! ✓

**Correct**
Marks for this submission: 1.00/1.00.

Question **7**
Correct
Mark 1.00 out of 1.00
Flag question

Write a Python program to append a new line at a specific position in a text file, shifting existing lines down.

**Description:**

1. **Input:**
   - A text file with multiple lines.
   - A line number to insert the new line at.
   - New content for the new line.
2. **Output:**
   - The updated file with the new line inserted at the specified position, shifting the existing lines down in file "output.txt".

**Example:**

- **Input File Content:**

  **"Line one.**
  **Line two.**
  **Line three.**
  **Line four."**
  **3**

  **Inserted line..**

**Output:**

Line one.
Line two.
Inserted line.
Line three.
Line four.

**For example:**

<table>
<tr><th>Test</th><th>Input</th><th>Result</th></tr>
<tr><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt
3
Inserted line.</pre></td><td><pre>Line one.
Line two.
Inserted line.
Line three.
Line four.</pre></td></tr>
</table>

**Answer:** (penalty regime: 0 %)

```python
filename = input()
line_no = int(input())
new_content = input()

with open(filename, 'r') as f:
    lines = f.read().split('\n')

lines.insert(line_no - 1, new_content)

with open('output.txt', 'w') as f:
    f.write('\n'.join(lines))
```

<table>
<tr><th></th><th>Test</th><th>Input</th><th>Expected</th><th>Got</th><th></th></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt
3
Inserted line.</pre></td><td><pre>Line one.
Line two.
Inserted line.
Line three.
Line four.</pre></td><td><pre>Line one.
Line two.
Inserted line.
Line three.
Line four.</pre></td><td>✓</td></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input2.txt
4
Inserted line D.</pre></td><td><pre>Line A.
Line B.
Line C.
Inserted line D.</pre></td><td><pre>Line A.
Line B.
Line C.
Inserted line D.</pre></td><td>✓</td></tr>
</table>

Passed all tests! ✓

**Correct**
Marks for this submission: 1.00/1.00.

Question **8**
Correct
Mark 1.00 out of 1.00
Flag question

Write a Python program to count the frequency of each word in a given text file.

**Description:**

1. **Input:**
   - String as input.
2. **Output:**
   - A list of words with their corresponding frequency count to be write in a file "output.txt"

**Example:**

- **Input File Content:**

  apple orange apple banana apple orange

**Output:**

apple: 3
orange: 2
banana: 1

**For example:**

<table>
<tr><th>Test</th><th>Input</th><th>Result</th></tr>
<tr><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>apple orange apple banana apple orange</pre></td><td><pre>apple: 3
banana: 1
orange: 2</pre></td></tr>
</table>

**Answer:** (penalty regime: 0 %)

```python
text = input()

count = {}
for word in text.lower().split():
    cleaned = ""
    for ch in word:
        if ch.isalnum():
            cleaned += ch
    if cleaned == "":
        continue
    if cleaned in count:
        count[cleaned] += 1
    else:
        count[cleaned] = 1

lines = []
for word in sorted(count):
    lines.append(word + ": " + str(count[word]))

with open('output.txt', 'w') as f:
    f.write('\n'.join(lines))
```

<table>
<tr><th></th><th>Test</th><th>Input</th></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>apple orange apple banana apple orange</pre></td></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>Hello world! Hello everyone. Welcome to the world of programming</pre></td></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>One fish two fish Red fish blue fish</pre></td></tr>
</table>

Passed all tests! ✓

**Correct**
Marks for this submission: 1.00/1.00.

Question **9**
Correct
Mark 1.00 out of 1.00
Flag question

Write a Python program to reverse the contents of a specific line in a text file based on a given line number.

**Description:**

1. **Input:**
   - A text file with multiple lines.
   - A line number to reverse.
2. **Output:**
   - The updated file with the specified line's contents reversed in file "output.txt".

**Example:**

- **Input File Content:**

  **"Line one.**
  **Line two.**
  **Line three.**
  **Line four."**
  **3**

**Output:**

Line one.
Line two.
eerht eniL.
Line four.

**For example:**

<table>
<tr><th>Test</th><th>Input</th><th>Result</th></tr>
<tr><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt
3</pre></td><td><pre>Line one.
Line two.
eerht eniL.
Line four.</pre></td></tr>
</table>

**Answer:** (penalty regime: 0 %)

```python
filename = input()
line_no = int(input())

with open(filename, 'r') as f:
    lines = f.read().split('\n')

if 1 <= line_no <= len(lines):
    line = lines[line_no - 1]
    if line.endswith('.'):
        lines[line_no - 1] = line[:-1][::-1] + '.'
    else:
        lines[line_no - 1] = line[::-1]

with open('output.txt', 'w') as f:
    f.write('\n'.join(lines))
```

<table>
<tr><th></th><th>Test</th><th>Input</th><th>Expected</th><th>Got</th><th></th></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input1.txt
3</pre></td><td><pre>Line one.
Line two.
eerht eniL.
Line four.</pre></td><td><pre>Line one.
Line two.
eerht eniL.
Line four.</pre></td><td>✓</td></tr>
<tr><td>✓</td><td><pre>with open('output.txt', 'r') as file:
    text = file.read()
    print(text)</pre></td><td><pre>input2.txt
2</pre></td><td><pre>Line A.
B eniL.
Line C.</pre></td><td><pre>Line A.

Line C.</pre></td><td>✓</td></tr>
</table>

Passed all tests! ✓

**Correct**
Marks for this submission: 1.00/1.00.

Question **10**
Correct
Mark 1.00 out of 1.00
Flag question

Create a Python program to find the longest word in a text file.

- **Input:**
  - A text file containing multiple lines of text.
- **Output:**
  - The longest word in the file.

**For example:**

| Input | Result |
|---|---|
| `input1.txt` | `Longest word: containing` |

**Answer:** (penalty regime: 0 %)

```python
filename = input()

with open(filename, 'r') as f:
    words = f.read().split()

longest = ""
for word in words:
    cleaned = ""
    for ch in word:
        if ch.isalnum():
            cleaned += ch
    if len(cleaned) > len(longest):
        longest = cleaned

print("Longest word:", longest)
```

| | Input | Expected | Got |
|---|---|---|---|
| ✓ | `input1.txt` | `Longest word: containing` | `Longest word: containing` |
| ✓ | `input2.txt` | `Longest word: thousand` | `Longest word: thousand` |
| ✓ | `input3.txt` | `Longest word: supercalifragilisticexpialidocious` | `Longest word: supercalifragilisticexpiali` |

Passed all tests! ✓

**Correct**
